Cal-Tech Project No. 05-674

Dear Mr. Logan,

Cal-Tech Testing, Inc. has performed nine soil borings at the referenced site in Columbia County, Florida. Three of those borings fall within a parcel having lateral dimensions of approximately 94 feet by 800 feet situated parallel to the southwesterly property line. The borings within this parcel are identified as borings B-4, B-5 and B-7 on the attached Boring Location Plan, and boring logs for these three borings are attached.

The purposes of our investigation were to evaluate the subsurface conditions in the area defined by the borings and to provide our opinion as to the suitability of the site soils for construction of proposed warehouse buildings. Support for these buildings is to be provided by monolithic foundations for which the foundations are to be located near the existing surface grade.

### Findings

The soil borings generally encountered three soil strata. The first layer consists of about 1 foot of silty sand (SM) and sand with silt (SP/SM). N-values of this layer were not determined. The second layer consists of about 1.5 feet of loose, clayey sand (SC). The third layer consists of an undetermined thickness of generally medium dense to dense sands (SP), sand with clay (SP/SC) and clayey sands (SC). These soils have N-values ranging from 9 to 39 blows per foot. Ground water was between the ground surface and a depth of about 1 foot.

### Discussion and Recommendations

Based upon our findings it is our opinion the site soils in the area of investigation are suitable to provide support for the proposed structures. We recommend however that the existing surface soils to a depth of about 1 foot be stripped from the site. The

subgrade should then be excavated as required to establish the appropriate bearing grades. The subgrade should then be proof-rolled using heavy, rubber-tired equipment and proof-compacted to a minimum of 95% of the Modified Proctor maximum dry density to a depth of 1 foot below the bottoms of foundations and slabs.

Fill materials may be placed as required. Fill should consist of relatively clean, fine sand containing less than 10% passing the No. 200 sieve. Fill should be placed in maximum 12-inch, loose lifts, and each lift should be proof-compacted to a minimum of 95% of the Modified Proctor maximum dry density.

Field density testing should be performed in the compacted subgrade and in each lift of fill to verify the recommended compaction has been performed.

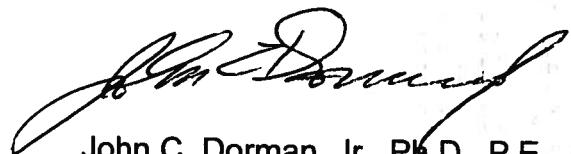

We have performed a bearing capacity evaluation for the site soils and have assumed a monolithic foundation with a bottom width of 18 inches and a thickness of 24 inches. Embedment is to be a minimum of 18 inches. For this foundation and the site soils as encountered, we obtained an allowable bearing pressure of 1,500 pounds per square foot with a minimum factor of safety of 1.8 against a bearing capacity failure. It is therefore our opinion the site soils are suitable for the proposed foundations and an allowable bearing pressure of 1,500 pounds per square foot.

We appreciate the opportunity to be of service on this project and look forward to a continued association. Please do not hesitate to contact us if you have questions or if we may be of further assistance.
