Yes, just wind load engineering and site plan with application for building permit. I assume going back in same location.

A zoning permit for the sign replacement will not be necessary.

You would possibly need building permits for the electrical portion and footer.

I have copied our building official on this email and will speak with him when he gets back into office.

Mr Goodin,
Thanks for taking the call. This sign is what we believe was there to begin with. We are adding the bracing and about 2ft in height. The roof that you may see in google maps photos will not be going back so that should take some of the wind load off. From what I could tell from my on-site visit, the poles had little to no concrete and I don't think were buried as deep as we are proposing..

Thanks,
Brad Raulerson
