alarms as well as any building alarms. The Redi-Reset® options eliminate the complication of a manual reset of the door after drop testing or activation. The Auto Fire-Tite® is also labeled for up to 4 hours of fire protection by UL, FM, and NYC MEA.

Auto Fire-Tite® curtains are constructed of galvanized or stainless steel in 2 3/4" flat and 3" curve slats, and can be finished with powder coating or baked enamel finishes. Each door is equipped with a 22 gage steel hood formed to fit the contour of the end brackets. Durable ductile iron endlocks with 1/4" semi-solid rivets. Our door supports and brackets are all steel plates no less than 1/4" thick. Alpine's Torsion Counterbalance Assembly is state of the art, providing maximum security and ease of use.

**Contact us today to find out which Alpine® solution is right for you!**

The Solid State Securities time delay release devices are normally energized as Fail-Safe devices incorporating state of the art electronic security control circuitry.

The Redi-Release series release devices respond to emergency conditions generated by manual or automatic normally closed initiating devices, and are designed to be used in conjunction with a temperature fuse link system. The Test-Release device features include time delay on alarm and power loss, motor voltage sensing, form C output, proximity/door edge input and trouble diagnostic capabilities. Check model label to be installed to verify applicable features.

**CAUTION:** As with all releasing device systems, maximum fire protection is provided when installed in accordance with factory specifications and used with fuse link systems. Fail-Safe operation can only be provided when input power is applied.

## LiftMaster Professional

### For Motorized Doors - Electro-Mechanical Operators

All models are UL, C-UL and CSFM listed and are compliant with the NFPA 80 requirement for a fail-safe door holder / releasing device. The various models include common features such as a vibration-resistant latching mechanism for the fusible link connection, mounting flexibility and disruption-free testing capabilities.

### PROJECT LOCATION

### LOCATION MAP

SECTION 17, TOWNSHIP 4 SOUTH, RANGE 17 EAST  
COLUMBIA COUNTY, FLORIDA

## GENERAL NOTES

1. The contractor shall verify all existing conditions and dimensions at the job site to insure that all new work will fit in the manner intended on the plans. Should any conditions exist that are contrary to those shown on the plans, the contractor shall notify the engineer of such differences immediately prior to proceeding with the work.
2. The contractor shall maintain the construction site at all times in a secure manner. All open trenches and excavated areas shall be protected from access by the general public.
3. Boundaries and topographical information shown was obtained from a survey performed by Donald F. Lee & Associates, LB # 7042.
4. Any public land corner within the limits of construction is to be protected. If a corner monument is in danger of being destroyed and has not been properly referenced, the contractor should notify the engineer.
5. The site is located in Section 17, Township 4 South, Range 17 East, Columbia County, Florida.
6. Contractors shall adhere to the Erosion Control Plan. All erosion control measures shall be implemented prior to construction and be continued until construction is complete.
7. All disturbed areas not sodded shall be seeded with a mixture of long-term vegetation and quick-growing short-term vegetation for the following conditions. For the months from September through March, the mix shall consist of 70 pounds per acre of long-term seed and 20 pounds per acre of winter rye. For the months of April through August, the mix shall consist of 70 pounds per acre of long-term seed and 20 pounds per acre of millet.
8. A pad of rubble riprap shall be placed at the bottom of all collection flumes and collection pipe outlets.
9. Existing drainage structures within the construction limits shall be removed, unless otherwise specified in the plans.
10. The location of the utilities shown in the plans is approximate only. The exact location shall be determined by the contractor during construction.
11. The contractor shall waste all excess earth on site as directed by the engineer.
12. All site construction shall be in accordance with the Columbia County Land Development Regulations.
13. Contractor shall review and become familiar with all required utility connections prior to bidding. Contractor shall provide all work and materials required to complete connection to the existing utilities. This includes, but is not limited to, manhole coring, wet taps, pavement repairs and directional boring.
14. Contractor shall coordinate all work with other contractors within project limits.
15. Contractor shall sod all slopes of 3' horizontal to 1' vertical and staple sod all slopes of 2' horizontal to 1' vertical.
16. All swales, depression areas and retention ponds shall be inspected monthly for sinkhole occurrence. Should a sinkhole occur, the area should be repaired as soon as possible. If a solution pipe sinkhole does form in the stormwater system, then the sinkhole shall be repaired by backfilling with a lower permeability material. A 2-foot cap that extends 2 feet beyond the perimeter of the sinkhole shall be constructed with clayey soils. The clayey soil should have at least 20% passing the number 200 sieve, compacted to 95% of Standard Proctor, and compacted in a wet condition with moisture 2%-4% above optimum. The clay soil cap shall be re-graded to prevent ponding and re-vegetated.
