This is your final set of plans for your file. Please review these plans immediately. Changes made to these drawings are subject to a redesign fee.

Contractor is responsible to verify all dimensions on your job site.

Some areas or local building departments may require sealed construction plans and/or energy sheets. Purchaser assumes the responsibility to determine if sealed plans are necessary and must notify Seller in writing at least thirty-five (35) days prior to the delivery date. Purchaser is responsible for all costs incurred by failure to notify Seller.

(Final Plans are Subject to Change by the engineer who seals the plans. If your plans require "sealing" DO NOT START CONSTRUCTION Until you receive your "sealed" plans from the engineer.)

FOUNDATION PLAN

1/4" = 1'-0"

SITE PREPARATION: SITE ANALYSIS AND PREPARATION INFORMATION IS NOT PART OF THIS PLAN AND IS RESPONSIBILITY OF THE OWNER. ALL FOUNDATIONS AND FOOTINGS ARE DESIGNED FOR STABLE SOIL CONDITIONS WITH 1000 PSF BEARING CAPACITY. SITE INSPECTION OF SOIL CONDITIONS SHALL DETERMINE IF THERE IS ANY EVIDENCE OF UNSUITABLE BEARING MATERIALS. QUESTIONABLE MATERIALS PRESENT SHOULD CALL FOR SOILS TESTS AND ANALYSIS BY GEOTECHNICAL ENGINEER TO ASSURE THAT EXPANDING CLAYS AND OTHER PROBLEMATIC SOILS CONDITIONS DO NOT EXIST OR TO ALLOW MITIGATION SHOULD THEY EXIST. ALL FILL UNDER STRUCTURAL ELEMENTS SHALL BE CLEAN SAND/SOIL FILL, FREE FROM DEBRIS AND ORGANIC MATERIALS COMPACTED IN LIFTS OF NOT MORE THAN 6 INCHES, LOOSE MEASURE. IT IS THE OWNER'S / BUILDER'S RESPONSIBILITY TO VERIFY EXISTING SOIL AND CLEAN FILL ARE COMPACTED TO 95% OF MAXIMUM DRY DENSITY PER THE MODIFIED PROCTOR TEST AND PROVIDE 2000 PSF MINIMUM BEARING CAPACITY OR REQUEST FOUNDATION DESIGN BASED ON ACTUAL SITE CONDITIONS.

FOUNDATION: ASSUMED SAFE BEARING CAPACITY OF 1000 PSF SHALL BE CONFIRMED IN THE FIELD BY A REGISTERED GEOTECHNICAL ENGINEER OR SHALL BE APPROVED BY THE OWNER. FOOTINGS AND SLABS ARE TO BEAR ON FIRM UNDISTURBED EARTH OR CLEAN SAND/SOIL FILL, FREE FROM DEBRIS AND ORGANIC MATERIALS COMPACTED IN LIFTS OF NOT MORE THAN 6 INCHES, LOOSE MEASURE. WHERE UNACCEPTABLE MATERIAL OCCURS, EXCAVATE AND REPLACE WITH ENGINEERED FILL. NO FOUNDATION CONCRETE SHALL BE INSTALLED UNTIL ALL FOUNDATION WORK HAS BEEN COORDINATED WITH UNDERGROUND UTILITIES. FOOTINGS SHALL BE LOWERED WHERE REQUIRED TO AVOID UTILITIES. TO MINIMIZE WEATHERING, THE LAST 6 INCHES OF EXCAVATION FOR ALL FOOTINGS SHALL BE MADE IMMEDIATELY PRIOR TO PLACEMENT OF FOOTINGS.

CONCRETE: MINIMUM COMPRESSIVE STRENGTH OF CONCRETE AT 28 DAYS SHALL BE F'c = 3000 PSI. WHERE EXCESS WATER IS ADDED TO THE CONCRETE SO THAT ITS SERVICABILITY IS DEGRADED, THE ATTAINMENT OF REQUIRED STRENGTH SHALL NOT RELEASE THE CONTRACTOR FROM PROVIDING SUCH MODIFICATIONS AS MAY BE REQUIRED BY THE ENGINEER TO PROVIDE A SERVICEABLE MEMBER OR SURFACE. ALL CONCRETE SHALL BE VIBRATED. NO REPAIR OR RUBBING OF CONCRETE SURFACES SHALL BE MADE PRIOR TO INSPECTION BY AND APPROVAL OF THE ENGINEER, OWNER OR HIS REPRESENTATIVE.

WELDED WIRE REINFORCED SLAB: 6" x 6" W1.4 x W1.4, FB = 85KSI, WELDED WIRE REINFORCEMENT FABRIC (W.W.M.) CONFORMING TO ASTM A185; LOCATED IN MIDDLE OF THE SLAB; SUPPORTED WITH APPROVED MATERIALS OR SUPPORTS AT SPACINGS NOT TO EXCEED 3'.

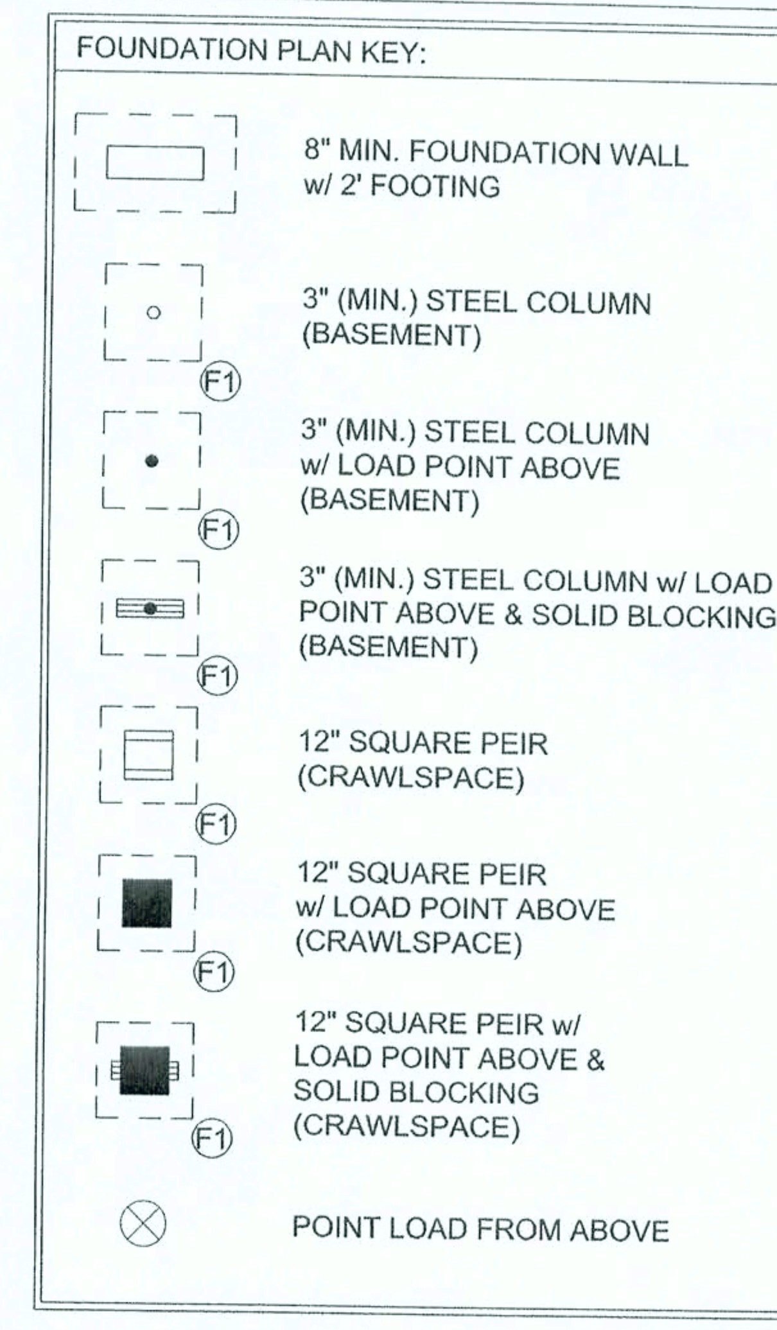
FIBER CONCRETE SLAB: CONCRETE SLABS ON GROUND CONTAINING SYNTHETIC FIBER REINFORCEMENT. FIBER LENGTHS SHALL BE 1/2 INCH TO 2 INCHES IN LENGTH. DOSAGE AMOUNTS SHALL BE FROM 0.75 TO 1.5 POUNDS PER CUBIC YARD IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS. SYNTHETIC FIBERS SHALL COMPLY WITH ASTM C 1116. THE MANUFACTURER OR SUPPLIER SHALL PROVIDE CERTIFICATION OF COMPLIANCE WITH ASTM C 1116 WHEN REQUESTED BY THE BUILDING OFFICIAL.

REBAR: ASTM A 615, GRADE 60, DEFORMED BARS, FY = 60 KSI. ALL LAPS SPLICES 40 * DB (25" FOR #5 BARS); UNO. ALL REINFORCEMENT SHALL BE DETAILED AND PLACED IN ACCORDANCE WITH ACI 315-95 WITH ACI 315-96 UNLESS NOTED OTHERWISE. ALL TENSION DEVELOPMENT LENGTHS SHALL BE 23 INCHES.

CONTROL JOINTS: WHERE SPECIFIED, SAWN CONTROL JOINTS IN SLAB-ON-GRADE SHALL BE CUT IN ACCORDANCE WITH ACI 302. JOINTS SHALL BE CUT WITHIN 12 HOURS OF SLAB PLACEMENT. THE LENGTH / WIDTH RATIOS OF SLAB AREAS SHALL NOT EXCEED 1.5 AND TYPICAL SPACING OF CUTS TO BE 12FT. DO NOT CUT WWM OR REINFORCING STEEL. (RECOMMENDED LOCATION OF CONTROL JOINTS IS SUBJECT TO OWNER AND CONTRACTOR'S APPROVAL. THE CONTROL JOINTS ARE NOT INTENDED TO PREVENT CRACKS BUT RATHER TO ENCOURAGE THE SLAB TO CRACK ON A GIVEN LINE.)

CONCRETE BLOCK: ASTM C-90 WITH MEDIUM SURFACE FINISH, F'm = 1500 PSI.

MORTAR: TYPE M OR N FOR ALL MASONRY UNITS.



GENERAL CRAWLSPACE NOTES:

1.) SOIL BEARING PRESSURE IS ASSUMED TO BE A MINIMUM OF 1000 PSF. IF SOIL CONDITIONS ARE FOUND TO BE LESS THAN THE ASSUMED, CONTACT A LOCAL STRUCTURAL ENGINEER FOR A RE-EVALUATION OF FOUNDATION PLAN.

2.) 8" x 16" CMU PIERS MAY BE USED INSTEAD OF 12" x 12". ADJUST FOOTING SIZE AND REBAR NUMBER ACCORDINGLY.

3.) DROP PORCH AND DECK PIER HEIGHT SO THAT TOP OF DECKING IS 5 5/8" BELOW MAIN HOUSE SUBFLOOR.

4.) FIREPLACE DIMENSIONS AND SPECIFICATIONS TO BE VERIFIED WITH OWNER BEFORE CONSTRUCTION.

5.) 12" x 12" FOUNDATION PIERS WITH 24" x 24" CONCRETE FOOTINGS ARE SHOWN. REINFORCE FOOTING WITH (3) #5 REBARS EACH WAY. 8" x 16" CMU PIERS MAY BE USED INSTEAD OF 12" x 12". ADJUST FOOTING SIZE AND REBAR NUMBER ACCORDINGLY.

6.) FOR REBAR PLACEMENT IN EXTERIOR FOUNDATION WALL FOOTING SEE "FOUNDATION/ BASEMENT" IN THE CONSTRUCTION DETAIL SHEETS.

7.) ALTHOUGH NO FOUNDATION VENTS ARE SHOWN, CONTRACTOR IS RESPONSIBLE FOR LOCATING AND INSTALLING VENTS. THE MINIMUM NET AREA OF VENT OPENINGS SHALL NOT BE LESS THAN 1 SQ. FT. FOR EACH 150 SQ. FT. OF CRAWLSPACE. ONE SUCH OPENING SHALL BE WITHIN 3 FT. OF THE CORNER OF THE BUILDING. FOR EXCEPTIONS SEE SBC.

8.) CRAWL SPACE HEIGHT TO BE A MINIMUM OF 18" FROM BOTTOM OF FLOOR JOIST TO TOP OF FINISH GRADE OR PER LOCAL CODE - WHICHEVER IS GREATER.

9.) 16" x 16" FULLY GROUTED MASONARY BLOCK COLUMN REQ'D @ EA. FOUNDATION END OF THE MULTIPLE 2X10 & GLULAM GIRDERS. REINFORCE EACH CELL w/ (1) #5 REBAR MIN. BOLT WOOD SEAT ATOP COLUMN FOR GIRDER TO BEAR UPON.

Test Data Review Certificate

Certificate #3026447B

This certifies that Intertek Testing Services/ETL Semko has reviewed structural load test data and documentation supplied by Masonite/Premdor Exterior Door Products on the product lines indicated below to determine the appropriate design load and impact ratings as specified by Miami-Dade County, Florida Protocol PA201, PA202 and PA203.

The data supplied was reviewed for applicability in support of the data contained in the Masonite/Premdor Product Performance Data Manual for the product line and product models indicated below. ITS/ETL Semko certifies that the test reports provided are consistent with the Masonite Certificate of Performance sheets (COP's) contained in the product performance data manual specified herein. The attached Masonite/Premdor COP/Test Report Validation Matrices (uniquely numbered by product model) provides correlation information for each product model reviewed indicating the test lab, report number(s), product size and installation information and ratings for design load and applicability of the large missile impact test. All applicable COP's and Matrices must bear the Warnock Hersey verification stamp .

Product Line: **Castlegate Entry Doors**

Product Models:
Wood-Edge Steel Door Units (Matrix #3026447B-001)

PREMDOR® ENTRY SYSTEMS

Installation Instructions for Pre-hung Units

"Premdor Entry Systems are designed for easy installation. Just follow these step-by-step instructions."

IMPORTANT: Read and understand the entire procedure before attempting to install a door. Use of dark colors and non-venting storm doors are not recommended for Premdor doors equipped with plastic glass insert frames and can void the warranty on the glass insert and doors. Observing this precaution will help reduce heat build-up between the door and storm door.

STEP 1. SELECT DOOR AND SIDELITE COMBINATIONS

- All doors pictured assume you are standing on the outside of the building.
- Door sizes used for this form are: 32" x 80" and 36" x 80".
- Rough openings are calculated using 14" wide sidelites. Deduct 2" from the rough opening width for each 12" sidelite or deduct 3-3/4" from RO width for each 10" sidelite.
- Rough opening width is measured from the inside of the stud frame to the inside of the opposite stud. Do not measure from gyproc, molding, or casings.
- Rough opening height is measured from the floor to the bottom of the header (top of rough opening). Rough opening height required is 82" for all doors which open in, and 81 1/4" for doors which open out.
- Rough opening size allows 1/4" shim space on each side of the door.
- To measure the rough opening on a door that is being replaced, remove interior casings to ensure accurate measurements from stud to stud and from floor to header.
- Note: It is easier to reduce the rough opening size by shimming or adding wall studs than it is to enlarge a rough opening.
- RO = Rough Opening (door viewed from the outside of building) Rough Opening Heights In-swing – 82", Out-swing – 81 1/4".
- When selecting a transom consult a store Associate for rough opening height specification.

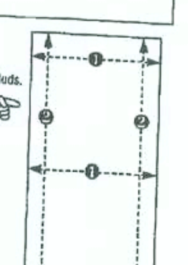
64"	☐ 66-3/4"	☐ 97-3/4"
72"	☐ 74-3/4"	☐ 105-3/4"

NOTE: Rough openings shown for 14" sidelites. For 12" sidelites deduct 2" for each sidelite. For 10" sidelites deduct 3-3/4" for each sidelite. For rough openings for doors with transoms, please see a Home Depot Associate.

STEP 2. DETERMINE DOOR FRAME SIZE

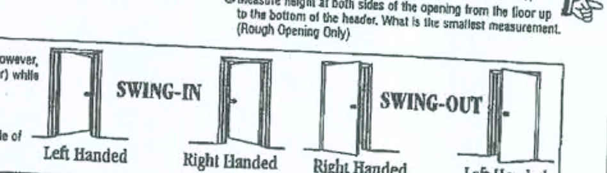
- 2" x 4" or 2" x 6" construction simply refers to the width of lumber used to frame the rough opening.
- Jamb is wider than framing lumber to allow the jamb to overlap the wallboard, panelling, siding etc.
- Brickmold covers the gap between the rough opening and the door jamb on the exterior wall and door casing should be applied on the interior.

How to measure for your new Premdor Entry System
1. Measure width at top, center, and bottom of opening between the studs. What is the smallest measurement. (Rough Opening Only)
2. Measure height at both sides of the opening from the floor up to the bottom of the header. What is the smallest measurement. (Rough Opening Only)



STEP 3. DETERMINE DOOR SWING

- All double door systems allow for both doors to open. However, during normal usage one door is stationary (inactive door) while the other door opens and closes (active door).
- Out-swing units supplied with a bumper type threshold.
- All doors pictured assume you are standing on the outside of the building.



STEP 4. TOOLS AND SUPPLIES

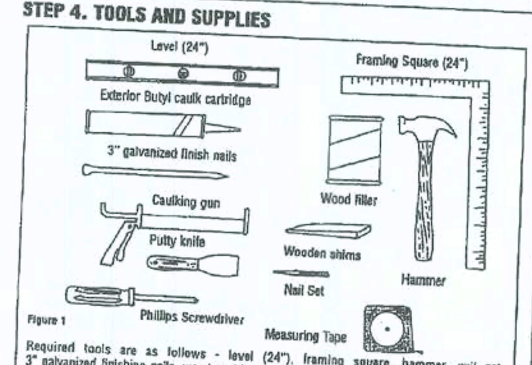


Figure 1

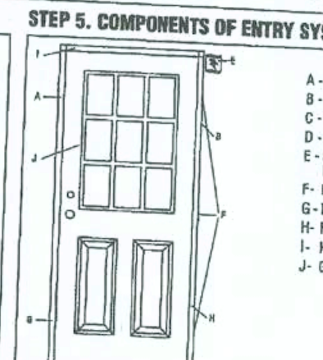
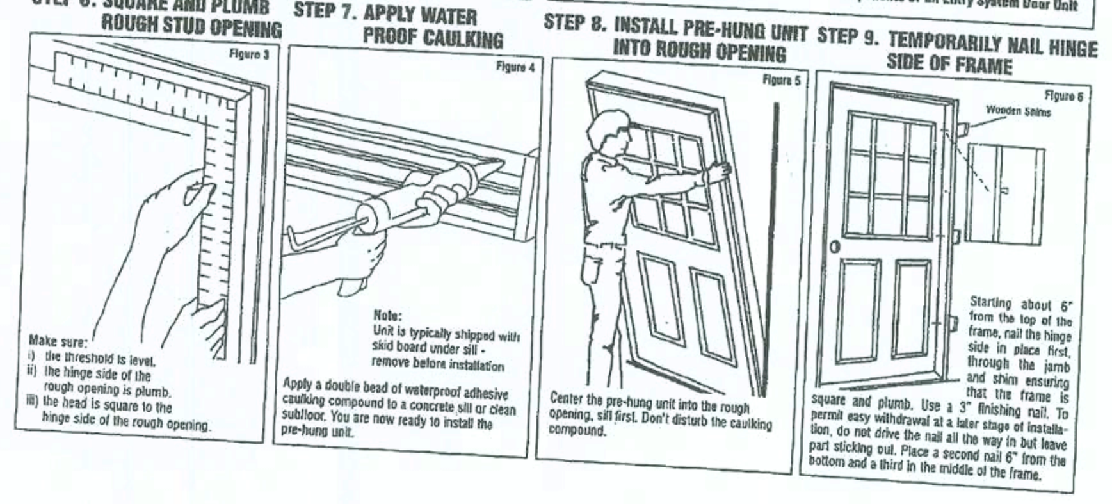
Required tools are as follows - level (24"), framing square, hammer, nail set, 3" galvanized finishing nails, wooden shims, wood filler, putty knife, caulking gun, exterior caulk, measuring tape and phillips screwdriver.

STEP 5. COMPONENTS OF ENTRY SYSTEM DOOR UNIT



A - Finger Jointed Pine Jamb
B - Compression Weatherstripping
C - Thermally Broken Sill
D - Door Sweep (installed)
E - Screw Bag and Installation Instructions
F - Hinges (3)
G - Lock Side Jamb
H - Hinge Side Jamb
I - Header
J - Glass Insert

Figure 2 Components of an Entry System Door Unit



STEP 6. SQUARE AND PLUMB ROUGH STUD OPENING (Figure 3)

Make sure:
i) the threshold is level.
ii) the hinge side of the rough opening is plumb.
iii) the head is square to the hinge side of the rough opening.

STEP 7. APPLY WATER PROOF CAULKING (Figure 4)

Note: Unit is typically shipped with skid board under sill - remove before installation

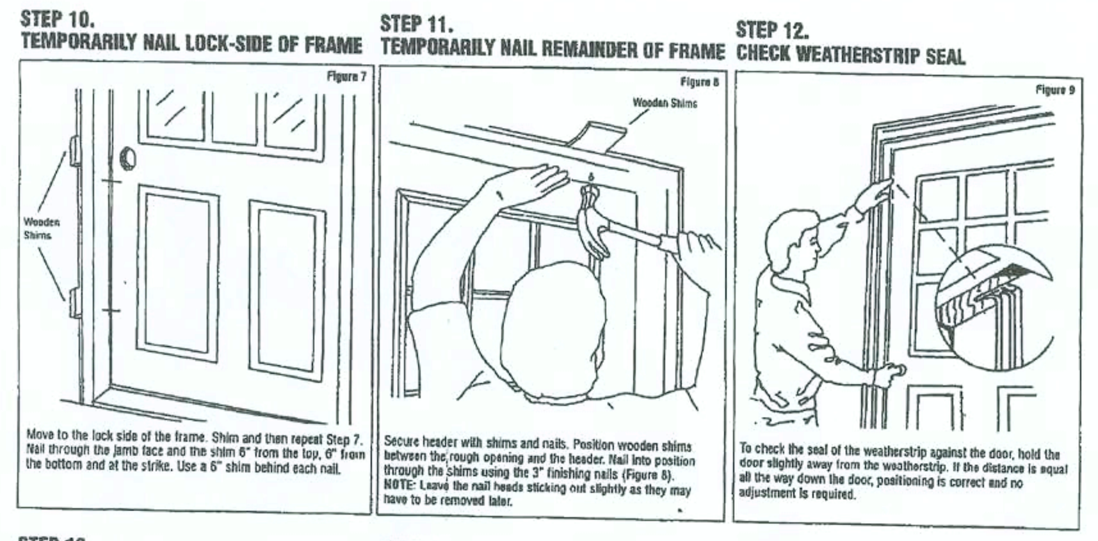
Apply a double bead of waterproof adhesive caulking compound to a concrete sill or clean subfloor. You are now ready to install the pre-hung unit.

STEP 8. INSTALL PRE-HUNG UNIT INTO ROUGH OPENING (Figure 5)

Center the pre-hung unit into the rough opening, sill first. Don't disturb the caulking compound.

STEP 9. TEMPORARILY NAIL HINGE SIDE OF FRAME (Figure 6)

Starting about 6" from the top of the frame, nail the hinge side in place first, through the jamb and shim ensuring that the frame is square and plumb. Use a 3" finishing nail. To permit easy withdrawal at a later stage of installation, do not drive the nail all the way in but leave part sticking out. Place a second nail 6" from the bottom and a third in the middle of the frame.



STEP 10. TEMPORARILY NAIL LOCK-SIDE OF FRAME (Figure 7)

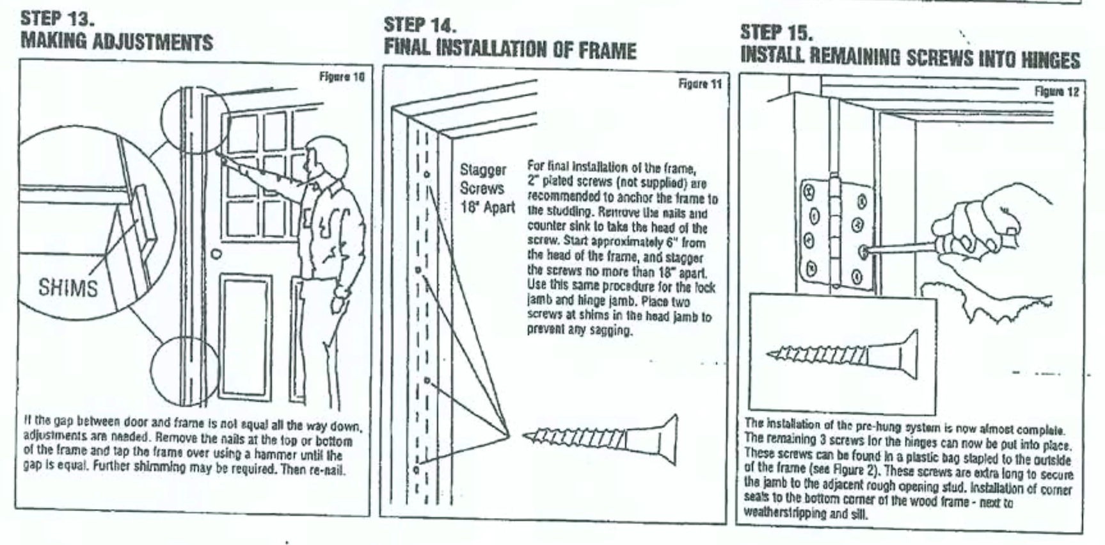
Move to the lock side of the frame. Shim and then repeat Step 7. Nail through the jamb face and the shim 6" from the top, 6" from the bottom and at the strike. Use a 6" shim behind each nail.

STEP 11. TEMPORARILY NAIL REMAINDER OF FRAME (Figure 8)

Secure header with shims and nails. Position wooden shims between the rough opening and the header. Nail into position through the shims using the 3" finishing nails (Figure 8). NOTE: Leave the nail heads sticking out slightly as they may have to be removed later.

STEP 12. CHECK WEATHERSTRIP SEAL (Figure 9)

To check the seal of the weatherstrip against the door, hold the door slightly away from the weatherstrip. If the distance is equal all the way down the door, positioning is correct and no adjustment is required.



STEP 13. MAKING ADJUSTMENTS (Figure 10)

If the gap between door and frame is not equal all the way down, adjustments are needed. Remove the nails at the top or bottom of the frame and tap the frame over using a hammer until the gap is equal. Further shimming may be required. Then re-nail.

STEP 14. FINAL INSTALLATION OF FRAME (Figure 11)

Stagger Screws 18" Apart

For final installation of the frame, 2" plated screws (not supplied) are recommended to anchor the frame to the studding. Remove the nails and counter sink to take the head of the screw. Start approximately 6" from the head of the frame, and stagger the screws no more than 18" apart. Use this same procedure for the lock jamb and hinge jamb. Place two screws at shims in the head jamb to prevent any sagging.

STEP 15. INSTALL REMAINING SCREWS INTO HINGES (Figure 12)

The installation of the pre-hung system is now almost complete. The remaining 3 screws for the hinges can now be put into place. These screws can be found in a plastic bag stapled to the outside of the frame (see Figure 2). These screws are extra long to secure the jamb to the adjacent rough opening stud. Installation of corner seals to the bottom corner of the wood frame - next to weatherstripping and sill.

STEP 16. FINAL FINISHING AND PAINTING

Use exterior grade caulking to seal around entire perimeter of door frame on the exterior wall and along the exterior nosing of the sill and building structure. Interior door casing should be installed around the door(s), covering the gap between the door frame and rough opening studs. You may want to consider filling this gap with loosely stuffed fiberglass insulation for an extra measure of insulation. Apply a bead of interior grade caulking around the door casing and wall and along the threshold and floor. Premdor doors have a factory applied coat of primer. Further prime painting is not recommended. Before applying a finish paint, scuff sand surface lightly with fine sandpaper and make sure door surfaces are thoroughly cleaned. Finish painting the outside of the door with a high quality exterior sash and trim latex or enamel paint. Use a high quality latex or enamel paint for the interior finish. Use of dark colors and non-venting storm doors are not recommended for Premdor doors equipped with plastic glass insert frames and can void the warranty on the glass insert and doors. Observing this precaution will help reduce heat build-up between the door and storm door.
Note : *Do not use alkyd paints.*

FOUNDATION PLAN

1/4" = 1'-0"

SITE PREPARATION: SITE ANALYSIS AND PREPARATION INFORMATION IS NOT PART OF THIS PLAN AND IS RESPONSIBILITY OF THE OWNER. ALL FOUNDATIONS AND FOOTINGS ARE DESIGNED FOR STABLE SOIL CONDITIONS WITH 1000 PSF BEARING CAPACITY. SITE INSPECTION OF SOIL CONDITIONS SHALL DETERMINE IF THERE IS ANY EVIDENCE OF UNSUITABLE BEARING MATERIALS. QUESTIONABLE MATERIALS PRESENT SHOULD CALL FOR SOILS TESTS AND ANALYSIS BY GEOTECHNICAL ENGINEER TO ASSURE THAT EXPANDING CLAYS AND OTHER PROBLEMATIC SOILS CONDITIONS DO NOT EXIST, OR TO ALLOW MITIGATION SHOULD THEY EXIST. ALL FILL UNDER STRUCTURAL ELEMENTS SHALL BE CLEAN SAND/SOIL FILL, FREE FROM DEBRIS AND ORGANIC MATERIALS COMPACTED IN LIFTS OF NOT MORE THAN 6 INCHES, LOOSE MEASURE. IT IS THE OWNER'S / BUILDER'S RESPONSIBILITY TO VERIFY EXISTING SOIL AND CLEAN FILL ARE COMPACTED TO 95% OF MAXIMUM DRY DENSITY PER THE MODIFIED PROCTOR TEST AND PROVIDE 2000 PSF MINIMUM BEARING CAPACITY OR REQUEST FOUNDATION DESIGN BASED ON ACTUAL SITE CONDITIONS.

FOUNDATION:
ASSUMED SAFE BEARING CAPACITY OF 1000 PSF SHALL BE CONFIRMED IN THE FIELD BY A REGISTERED GEOTECHNICAL ENGINEER OR SHALL BE APPROVED BY THE OWNER. FOOTINGS AND SLABS ARE TO BEAR ON FIRM UNDISTURBED EARTH OR CLEAN SAND/SOIL FILL, FREE FROM DEBRIS AND ORGANIC MATERIALS COMPACTED IN LIFTS OF NOT MORE THAN 6 INCHES, LOOSE MEASURE. WHERE UNACCEPTABLE MATERIAL OCCURS, EXCAVATE AND REPLACE WITH ENGINEERED FILL. NO FOUNDATION CONCRETE SHALL BE INSTALLED UNTIL ALL FOUNDATION WORK HAS BEEN COORDINATED WITH UNDERGROUND UTILITIES. FOOTINGS SHALL BE LOWERED WHERE REQUIRED TO AVOID UTILITIES. TO MINIMIZE WEATHERING, THE LAST 6 INCHES OF EXCAVATION FOR ALL FOOTINGS SHALL BE MADE IMMEDIATELY PRIOR TO PLACEMENT OF FOOTINGS.

CONCRETE: MINIMUM COMPRESSIVE STRENGTH OF CONCRETE AT 28 DAYS SHALL BE F'c = 3000 PSI. WHERE EXCESS WATER IS ADDED TO THE CONCRETE SO THAT ITS SERVICABILITY IS DEGRADED, THE ATTAINMENT OF REQUIRED STRENGTH SHALL NOT RELEASE THE CONTRACTOR FROM PROVIDING SUCH MODIFICATIONS AS MAY BE REQUIRED BY THE ENGINEER TO PROVIDE A SERVICEABLE MEMBER OR SURFACE. ALL CONCRETE SHALL BE VIBRATED. NO REPAIR OR RUBBING OF CONCRETE SURFACES SHALL BE MADE PRIOR TO INSPECTION BY AND APPROVAL OF THE ENGINEER, OWNER OR HIS REPRESENTATIVE.

WLDED WIRE REINFORCED SLAB: 6" x 6" W1.4 x W1.4, FB = 85KSI, WELDED WIRE RENFORCEMENT FABRIC (W.W.M.) CONFORMING TO ASTM A185; LOCATED IN MIDDLE OFTHE SLAB; SUPPORTED WITH APPROVED MATERIALS OR SUPPORTS AT SPACINGS NOT TO EXCEED 3'.

FIER CONCRETE SLAB: CONCRETE SLABS ON GROUND CONTAINING SYNTHETIC FIER REINFORCEMENT. FIBER LENGTHS SHALL BE 1/2 INCH TO 2 INCHES IN LENGTH. DOSAGE AMOUNTS SHALL BE FROM 0.75 TO 1.5 POUNDS PER CUBIC YARD IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS. SYNTHETIC FIERS SHALL COMPLY WITH ASTM C 1116. THE MANUFACTURER OR SUPPLIER SHALL PROVIDE CERTIFICATION OF COMPLIANCE WITH ASTM C 1116 WHEN REQUESTED BY THE BUILDING OFFICIAL.

REBAR: ASTM A 615, GRADE 60, DEFORMED BARS, FY = 60 KSI. ALL LAPS SPLICES 40 * DB25" FOR #5 BARS); UNO. ALL REINFORCEMENT SHALL BE DETAILED AND PLACED IN ACCORDANCE WITH ACI 315-95 WITH ACI 315-96 UNLESS NOTED OTHERWISE. ALL TENSION DEVELOPMENT LENGTHS SHALL BE 23 INCHES.

CONTROL JOINTS: WHERE SPECIFIED, SAWN CONTROL JOINTS IN SLAB-ON-GRADE SHALL BE CUT IN ACCORDANCE WITH ACI 302. JOINTS SHALL BE CUT WITHIN 12 HOURS OF SLAB PLACEMENT. THE LENGTH / WIDTH RATIOS OF SLAB AREAS SHALL NOT EXCEED 1.5 AND TYPICAL SPACING OF CUTS TO BE 12FT. DO NOT CUT WWM OR REINFORCING STEEL. (RECOMMENDED LOCATION OF CONTROL JOINTS IS SUBJECT TO OWNER AND CONTRACTOR'S APPROVAL. THE CONTROL JOINTS ARE NOT INTENDED TO PREVENT CRACKS BUT RATHER TO ENCOURAGE THE SLAB TO CRACK ON A GIVEN LINE.)
