SCALE: N.T.S.

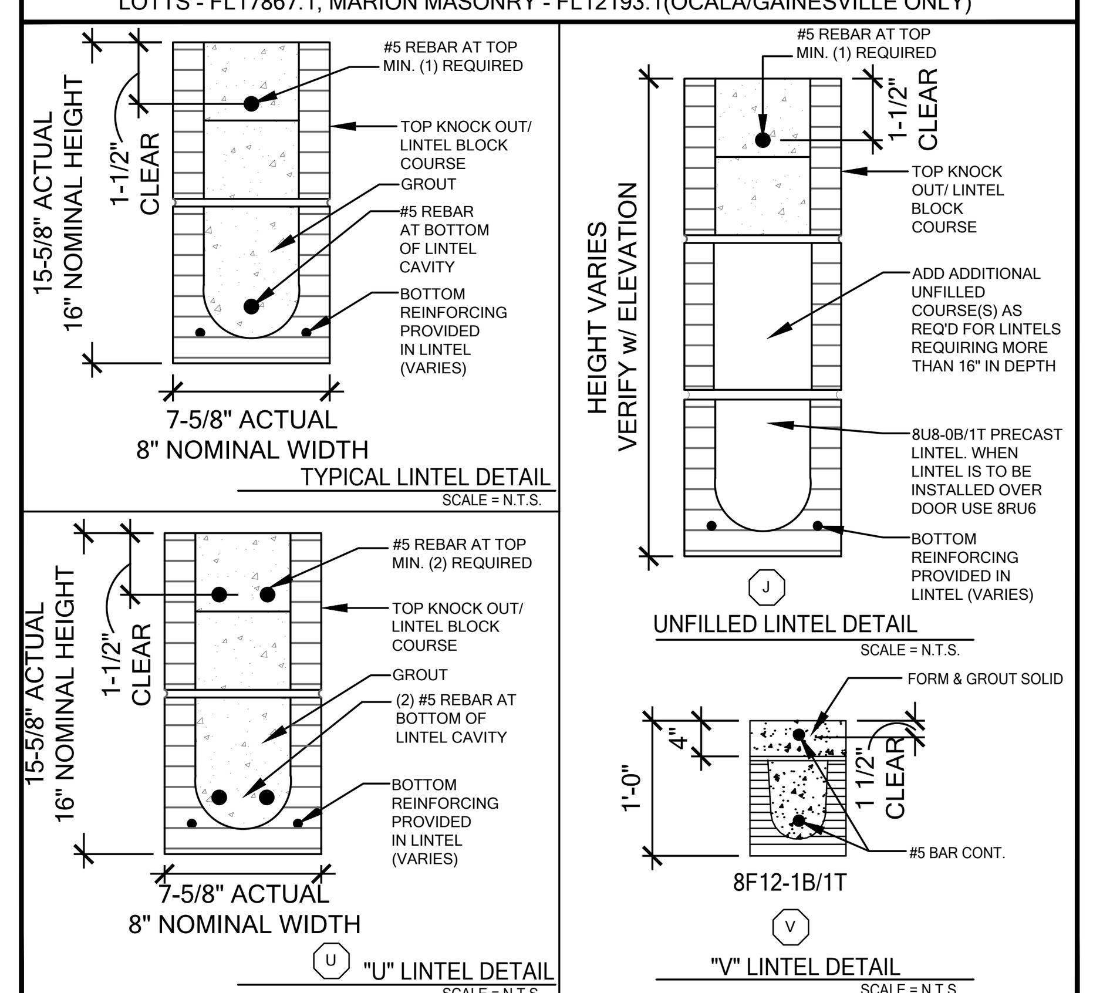
GENERAL LINTEL NOTES

1. AREAS OF BLOCK ABV. MASONRY OPENINGS ARE TO BE GROUTED SOLID TO TIE BEAM.
2. (1) #5 (GRADE 40) REBAR IN TIE BEAM IS TO BE CONT. THROUGH OUT INCLUDING ABV. MASONRY OPENINGS. U.N.O.
3. ALL STANDARD AND RECESS LINTELS TO HAVE MIN. 4" BEARING EA. END BASED ON MANUFACTURER SPECS.
4. LINTEL MINIMUM DEPTHS ARE CALLED OUT ON LINTEL PLAN. IF CONTRACTOR INSTALLS A DEEPER LINTEL THAN INDICATED ON THE PLAN, DOING THIS INCREASES THE STRENGTH OF THE LINTEL AND IS APPROVED WITHOUT ENGINEERING LETTER. IF A SMALLER LINTEL IS INSTALLED CONTACT EOR FOR APPROVAL.

NOTE: ALL LINTEL DIMENSIONS SHOWN ARE "OVERALL" LINTEL LENGTHS. GC TO VERIFY ALL LINTEL DIMENSIONS IN FIELD

GENERAL CONCRETE LINTEL SCHEDULE

APPROVED LINTEL MANUFACTURERS: CAST-CRETE - FL158.1, QUALITY/PRO CRETE - FL23932, LOTTS - FL17867.1, MARION MASONRY - FL12193.1(OCALA/GAINESVILLE ONLY)



MATERIALS

1. f'c precast lintels = 3500 psi.
2. f'c prestressed lintels = 6000 psi.
3. grouted per ASTM C476 f'g = 3000 psi w/ maximum 3/8" aggregate and 8" to 11" slump.
4. Concrete masonry units (CMU) per ASTM C90 w/ minimum net area compressive strength = 1900 psi.
5. Rebar per ASTM A615 Grade 60. Prestressing strand per ASTM A416 grade
6. 270 low relaxation. 7/32 wire per ASTM A510.
7. Mortar per ASTM C270 type M or S.

GENERAL INSTALLATION NOTES

1. Provide full mortar head and bed joints.
2. Shore filled lintels as required.
3. Installation of lintel must comply with the architectural and/or structural drawings.
4. U-Lintels are manufactured with 5-1/2" long notches at the ends to accommodate vertical cell reinforcing and grouting.
5. All lintels meet or exceed L/360 vertical deflection, except lintels 17'-4" and longer with a nominal height of 8" meet or exceed L/180.
6. Bottom field added rebar to be located at the bottom of the lintel cavity.
7. 7/32" diameter wire stirrups are welded to the bottom steel for mechanical anchorage.
8. Cast-in-place concrete may be provided in composite lintel in lieu of concrete masonry units.
9. Safe load ratings based on rational design analysis per ACI 318 and ACI 530
10. Florida Product Approval No. 158.1
11. The exterior surface of lintels installed in exterior concrete masonry walls shall have a coating of stucco applied in accordance with ASTM C-926 or other approved coating.
12. Lintels loaded simultaneously with vertical (gravity and uplift) and horizontal (lateral) loads should be checked for combine loading with the following equation:

$$\frac{\text{Applied vertical load}}{\text{Safe vertical load}} + \frac{\text{Applied horizontal load}}{\text{Safe horizontal load}} \leq 1.0$$

FLASHING REQUIREMENTS

R703.1 General. Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing as described in Section R703.4.

R703.1.1 Water resistance. The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a water-resistant barrier behind the exterior cladding as required by Section R703.2 and a means of draining to the exterior water that penetrates the exterior cladding.

R703.2 Water-resistive barrier. Not fewer than one layer of water-resistive barrier shall be applied over studs or sheathing of all exterior walls with flashing as indicated in Section R703.4, in such a manner as to provide a continuous water-resistive barrier behind the exterior wall veneer. The water-resistive barrier material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1. Water-resistive barrier materials shall comply with one of the following:
1. No. 15 felt complying with ASTM D226, Type 1.
2. ASTM E2568, Type 1 or 2.
3. ASTM E331 in accordance with Section R703.11.
4. Other approved materials in accordance with the manufacturer's installation instructions.

No. 15 asphalt felt and water-resistive barriers complying with ASTM E2556 shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm), and where joints occur, shall be lapped not less than 6 inches (152 mm).

R703.7.3 Water-resistive barriers Water-resistive barriers shall be installed as required in Section R703.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section R703.4) intended to drain to the water-resistive barrier is directed between the layers.
Exception: Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60-minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or designed drainage space.

R703.4 Flashing. Approved metal flashing, vinyl flashing, self-adhered membranes and mechanically attached flexible flashing shall be applied shingle-fashion or in accordance with the manufacturer's instructions. Metal flashing shall be corrosion resistant. Fluid-applied membranes used as flashing shall be applied in accordance with the manufacturer's instructions. All flashing shall be applied in a manner to prevent the entry of water into the wall cavity or penetration of water to the building structural framing components.
Self-adhered membranes used as flashing shall comply with AAMA 711. All exterior fenestration products shall be sealed at the juncture with the building wall with a sealant complying with AAMA 800 or ASTM C920 Class 25 Grade NS or greater for proper joint expansion and contraction, ASTMC1281, AAMA 812, or other approved standard as appropriate for the type of sealant. Fluid-applied membranes used as flashing in exterior walls shall comply with AAMA 714. The flashing shall extend to the surface of the exterior wall finish. Approved flashings shall be installed at the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier complying with Section 703.2 for subsequent drainage. Mechanically attached flexible flashings shall comply with AAMA 712. Flashing at exterior window and door openings shall be installed in accordance with one or more of the following:
   1.1 The fenestration manufacturer's installation and flashing instructions, or for applications not addressed in the fenestration manufacturer's instructions, in accordance with the flashing or water-resistive barrier manufacturer's instructions. Where flashing instructions or details are not provided, pan flashing shall be installed at the sill of exterior window and door openings. Pan flashing shall be sealed or sloped in such a manner as to direct water to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Openings using pan flashing shall incorporate flashing or protection at the head and sides.
   1.2 In accordance with the flashing design or method of a registered design professional.
   1.3 In accordance with other approved methods.
   1.4 In accordance with FMA/AAMA 100, FMA/ AAMA 200, FMA/WDMA 250, FMA/AAMA/ WDMA 300, FMA/AAMA/WDMA 400 or FMA/AAMA/WDMA 2710.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

Technical Tip

Overdriven Fasteners in ZIP System® Sheathing

Nails used to attach ZIP System sheathing to supporting framing members may occasionally penetrate beyond the face of the ZIP System panels. An ideal installation would be where fastener heads are flush with the panel surface. For this correspondence, "Overdriven Fasteners," are defined as nails that are installed through the panel and into a framing member, like a wall stud or rafter, with the fastener head penetrating into the integrated moisture barrier.

For roof applications, ZIP System sheathing is code recognized in ICC-ES ESR-1473 as a combination roof sheathing and roof underlayment. When used on a wall, ZIP System sheathing is code-recognized in ICC-ES ESR-1474 as a combination wall sheathing, air barrier and water-resistive barrier. Both International and Residential Building codes have specific requirements on fastener types, size and spacing when attaching wood structural panels as roof or wall sheathing. Minimum required fastening and allowable shear values required by code are based on the assumption that fasteners are installed flush with the sheathing surface. Due to variations in materials and limitations on equipment, this may be difficult to achieve in some situations. According to the TECO Tech Tip, *Reduction in Shear Capacity Due to Overdriven Fasteners*, shear capacity could be reduced up to 25% depending on the depth and amount of fasteners that are overdriven. Please refer to technical bulletins published by APA and TECO at www.apawood.org and www.tecotested.com for more information about reduced shear capacity due to overdriven fasteners. Consult your local building official or design professional for any additional nailing that may be required due to overdriven fasteners.

ZIP System Sheathing has been tested against water penetration in both laboratory and field conditions using standard ASTM tests at specified pressures. Panels were tested with overdriven fasteners at various depths and then compared with panels that were tested with fastener heads flush. The panels with overdriven fasteners satisfied the same performance requirements as panels installed with fastener heads flush. Huber Engineered Woods does not require taping or sealing overdriven fasteners. ZIP System panels that are attached with overdriven fasteners will not void the ZIP System warranty.

Although overdriven fasteners do not affect ZIP System sheathing's ability to resist moisture, it may reduce the shear capacity of the fastener. Overdriven fasteners can reduce the amount of wind or earthquake loading a shear wall is designed to resist. This possible reduction in shear capacity is inherent with all diaphragms and shear walls constructed with structural OSB or plywood and is NOT specific to ZIP System products.

Please contact Huber Engineered Woods at 800-933-9220 with any questions or comments.

R703.2 Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

Technical Tip

Overdriven Fasteners in ZIP System® Sheathing

Nails used to attach ZIP System sheathing to supporting framing members may occasionally penetrate beyond the face of the ZIP System panels. An ideal installation would be where fastener heads are flush with the panel surface. For this correspondence, "Overdriven Fasteners," are defined as nails that are installed through the panel and into a framing member, like a wall stud or rafter, with the fastener head penetrating into the integrated moisture barrier.

For roof applications, ZIP System sheathing is code recognized in ICC-ES ESR-1473 as a combination roof sheathing and roof underlayment. When used on a wall, ZIP System sheathing is code recognized in ICC-ES ESR-1474 as a combination wall sheathing, air barrier and water-resistive barrier. Both International and Residential Building codes have specific requirements on fastener types, size and spacing when attaching wood structural panels as roof or wall sheathing. Minimum required fastening and allowable shear values required by code are based on the assumption that fasteners are installed flush with the sheathing surface. Due to variations in materials and limitations on equipment, this may be difficult to achieve in some situations. According to the TECO Tech Tip, *Reduction in Shear Capacity Due to Overdriven Fasteners*, shear capacity could be reduced up to 25% depending on the depth and amount of fasteners that are overdriven. Please refer to technical bulletins published by APA and TECO at www.apawood.org and www.tecotested.com for more information about reduced shear capacity due to overdriven fasteners. Consult your local building official or design professional for any additional nailing that may be required due to overdriven fasteners.

ZIP System Sheathing has been tested against water penetration in both laboratory and field conditions using standard ASTM tests at specified pressures. Panels were tested with overdriven fasteners at various depths and then compared with panels that were tested with fastener heads flush. The panels with overdriven fasteners satisfied the same performance requirements as panels installed with fastener heads flush. Huber Engineered Woods does not require taping or sealing overdriven fasteners. ZIP System panels that are attached with overdriven fasteners will not void the ZIP System warranty.

Although overdriven fasteners do not affect ZIP System sheathing's ability to resist moisture, it may reduce the shear capacity of the fastener. Overdriven fasteners can reduce the amount of wind or earthquake loading a shear wall is designed to resist. This possible reduction in shear capacity is inherent with all diaphragms and shear walls constructed with structural OSB or plywood and is NOT specific to ZIP System products.

Use of ZIP System® Wall Sheathing recognized in this report is subject to the following limitations:

2.1 ZIP System® Wall Sheathing shall be installed in accordance with the applicable code, the manufacturer's published installation instructions, and this report. Where there is a conflict, the most restrictive requirements shall govern.

2.2 ZIP System® Wall Sheathing panels are limited to code approved structural use for wood structural panels with a 24/16, 32/16, or 40/20 span rating, depending on the panel thickness.

2.3 Building envelope performance verification shall be performed as defined in Section C402.5.1.5 of the 2021 IECC, when the 2021 IECC is applicable.

2.4 ZIP System® Wall Sheathing is manufactured in Crystal Hill, VA; Commerce, GA; Broken Bow, OK; Easton, ME; Spring City, TN; and Shawinigan, QC.

3.0 PRODUCT USE

3.1 General: ZIP System® Wall Sheathing panels are used as wall sheathing in accordance with Section 2303.1.5 of the IBC, and Section R602.1.8 of the IRC. The panels are also used as a water-resistive barrier in accordance with Chapter 14 of the IBC and Chapter 7 of the IRC and as the water-resistive barrier required in accordance with IBC Section 2510.6. The sheathing is recognized for use in Type V construction in the IBC and buildings and structures constructed under the IRC.

3.2 Installation:

3.2.1 Installation General: Installation of the ZIP System® Wall Sheathing panels shall comply with the applicable code listed in Section 1.0 of this report, this report, and the manufacturer's published installation instructions. The installation instructions shall be available at the job site during installation. If there are any conflicts between the manufacturer's published instructions and this report, the more stringent requirements shall govern.

3.2.2 Installation of Sheathing Panel: The ZIP System® Wall Sheathing shall be installed with the laminated moisture barrier surface overlay facing the exterior. The panels shall be attached to the framing in accordance with the applicable code listed in Section 1.0 of this report for PS-2 wood structural panels, as applicable. Tongue-and-groove and machined edges are designed to provide the correct gap between panels during installation. Square-edged panels shall be spaced with a $^{1}/_{8}$-inch (3.2 mm) minimum gap.

All ZIP System® Wall Sheathing seams shall be sealed with ZIP System™ Flexible Flashing Tape, a self-adhering sheet-type membrane consisting of acrylic adhesive laminated to a polyolefin backing, or ZIP System™ Liquid Flash. The ZIP System™ flashing products are outside the scope of recognition of this report and documentation demonstrating code compliance shall be provided to the building official for approval upon request. All penetrations of the sheathing surface overlay such as cracking, openings, etc., caused by

handling or construction work, also shall be sealed. Panel surfaces shall be dry and free from any significant presence of particles, sawdust, or other debris, or protrusions prior to sealing. The tape is available in rolls of varying lengths and widths and, when used for sealing panel seams, shall be a minimum of 3¾ inches (95 mm) wide. The tape shall be centered within ± ½ inch (12.7 mm) of all panel edge seam centers and shall extend a minimum of 1 inch (25.4 mm) past the panel edge T-joint intersections. Wrinkles in the ZIP System™ Flexible Flashing Tape are acceptable unless they create a leak path to the panel seam. If using ZIP System™ liquid flash in lieu of ZIP System™ Flexible Flashing Tape, a minimum of 1-inch of liquid flashing material shall be applied to each panel edge across the seams and T-joint intersections. ZIP System™ liquid flash shall be installed to a minimum thickness of 12 mils (0.305 mm).

3.2.3 Substrate Preparation for Application of Cement Plaster or Adhered Masonry Veneer: Figures 1, 2, and 3 depict stucco or adhered stone wall assembly details when utilizing ZIP System wall sheathing in accordance with the IBC or IRC.

3.3 Air Permeability: A code compliant air barrier assembly is provided by ZIP System® Wall Sheathing panels installed with minimum nominally 2x4 wood studs spaced at a maximum of 24 inches (610 mm) on center and sheathed with minimum $^{7}/_{16}$-inch-thick (11.1 mm) ZIP System® Wall Sheathing panels fastened with 2-inch-long (51 mm) 6d common nails spaced at 6 inches (152 mm) on center at the perimeter and 12 inches (305 mm) on center in the field. The joints between the panels shall be sealed with ZIP System™ Flexible Flashing Tape. 4.0 PRODUCT DESCRIPTION

4.1 ZIP System® Wall Sheathing Panels. The ZIP System® Wall Sheathing panels are wood structural panels with a moisture barrier surface laminated on the exterior side. The panels are installed with ZIP System™ Flexible Flashing Tape or Zip System™ Liquid Flash sealing all seams, which allows the panels to be used to meet the water-resistive barrier requirements in Chapter 14 and Section 2510.6 of the IBC and Section R703.7.3 of the IRC . The wood structural panel substrate complies with US DOC PS-2, as applicable. The moisture barrier surface on the wood structural panel is a medium density phenolic-impregnated overlay with a water resistance equivlance to an ASTM E2556 Type II or 60 minute Grade D water-resistive barrier. The ZIP System Wall sheathing meets the minimum drainage efficiency of 90 percent when tested in accordance with ASTM E2273. The standard-size panels are nominally 4 feet by 8 feet (1219 mm by 2438 mm). Panels longer than 8 feet (2438 mm) in length are also produced. The panels are available in $^{7}/_{16}$-, $^{15}/_{32}$-, $^{1}/_{2}$-, and $^{5}/_{8}$-inch performance categories (11.1 mm, 11.9 mm, 12.7 mm, and 15.9 mm) with either a self-spacing or square edge profile, and with a tongue-and-groove edge profile also available for the $^{5}/_{8}$-inch-thick (15.9 mm) panels.

Notes:
1. Installation depicted based off of structural test report B9171.01.
2. Wood screws shall satify the National Design Specification for Wood Construction for material type and dimensional requirements.
3. Wood buck installations are assumed 2x S-P-F (G=0.42) or denser. Buck width shall be greater than the window frame width. Tapered or partial width bucks are not allowed. Wood buck shall be secured to the structure to resist all design loads.
4. Wood screw lengths shall be sufficient to guarantee 1-1/4" penetration into wood buck.
5. Maximum shim thickness of 1/4" permitted at each fastener location. Shims shall be load bearing, non-compressible type.
6. These drawings depict the details necessary to meet structural load requirements. They do not address the air infiltration, water penetration, intrusion or thermal performance requirements of the installation.
7. Installation shown is that of the test window for the size shown and the design pressure claimed. For window sizes smaller than shown, locate jamb fasteners 2" from corners and no more than 10" on center. Locate head/sill fasteners 2" from corners and no more than 10" on center. Design pressures of smaller window sizes are limited to that of the test window.
